

Website Deployment Guide

Cleaning Business Launch Kit

Welcome to your custom Next.js website package! This guide will walk you through publishing your website to the internet so your customers can find you. We have provided instructions for the easiest automated method (Vercel), traditional shared hosting (Hostinger), and local testing.

Option 1: The Easiest Way (Vercel)

We highly recommend this method. It is free, requires no technical knowledge, and automatically updates your website anytime you make changes.

Part 1: Upload to GitHub

- 1 Extract (unzip) your downloaded website folder.
- 2 Go to **github.com** and create a free account.
- 3 Click "New Repository" and give it a name (e.g., *my-cleaning-site*). Leave it Public or Private.
- 4 Drag and drop all the files from your extracted folder directly into the GitHub repository page. Click "Commit changes".

Part 2: Connect to Vercel

- 1 Go to **vercel.com** and sign up using your new GitHub account.
- 2 Click "Add New" > "Project".
- 3 You will see your GitHub repository listed. Click **Import** next to it.
- 4 Leave all settings as default and click **Deploy**.

Done! Vercel will build your site and provide you with a live URL within 2 minutes.

Option 2: Shared Hosting (Hostinger)

If you already purchased hosting via Hostinger, you can connect it directly to GitHub.

- 1 Follow "Part 1: Upload to GitHub" from the Vercel instructions above.
- 2 Log in to your Hostinger Control Panel (hPanel).
- 3 Go to **Advanced** > **Git** in your dashboard.
- 4 Connect your GitHub account and select your repository.
- 5 Hostinger will pull the files. Follow their prompts to complete the Node.js build process.

Option 3: Run Locally (Advanced / Testing)

If you are a technical user and want to test the website on your own machine before uploading, follow these steps.

System Requirements

- **Node.js:** Version 20.9 or higher is required.
- **Terminal:** Command Prompt (Windows) or Terminal (Mac/Linux).
- **Code Editor:** Visual Studio Code (Optional but recommended).

Commands

Open your terminal, navigate to your unzipped folder, and run:

```
npm install
```

This installs all necessary project dependencies.

To test the website live on your computer:

```
npm run dev
```

Open your browser and visit **http://localhost:3000** to see the live preview.

To generate the final static HTML files for manual upload:

```
npm run build
```

Note: Because your Next.js config is set to *output: 'export'*, this will create an **out/** folder containing pure HTML, CSS, and JS. You can manually drag the contents of this folder into any basic web hosting File Manager.
